ESEC/FSE 2023

Program Accepted Papers FAQ Call for Papers

FAQ

FAQ on Review Process: Major Revisions, Open Science Policy, Double-Anonymous Reviewing

Major Revision Process

Q: Why is ESEC/FSE allowing major revisions?

A: SE conferences are currently forced to reject papers that include valuable material, but would need major changes to become acceptable for conference presentation, because major revisions cannot be accommodated in the current review process. By supporting only a binary outcome, conferences force reviewers to decide between rejection and acceptance even in borderline cases that would be better judged after a round of major revision. This can cause additional reviewing burden for the community (the paper is resubmitted to another venue with new reviewers) and inconsistency for the authors (the new reviewers have different opinions). We hope by allowing major revisions to both increase the acceptance rate of ESEC/FSE and to help reduce these current problems with the reviewing process.

For Authors

Q: If my paper receives major revisions, what happens next?

A: The *meta-review* will clearly and explicitly list all major changes required by the reviewers to make the paper acceptable for publication. Authors of these papers are granted *8 weeks* to implement the requested changes. In addition to the revised paper, authors are asked to submit a response letter that explains how each required change was implemented. If any change was not implemented, authors can explain why. The same reviewers will then review the revised paper and make their final (binary) decision. Authors can also choose to withdraw their submission if they wish.

Q: Will major revision become the default decision causing initial acceptance rates to drop?

A: This is not the intention: reviewers are instructed to accept all papers that would have been accepted when *major revision* was not an available outcome.

For Reviewers

Q: When shall I recommend *major revision* for a paper?

A: *Major revision* should not become the default choice for borderline papers and should be used only if without major revisions the paper would be rejected, while a properly done major revision, which addresses the reviewers' concerns, could make the paper acceptable for publication; if the requested changes are doable in 8 weeks and are implementable within the page limit; if the requested changes are strictly necessary for paper acceptance (i.e., not just nice-to-have features); if the requested changes require recheck (i.e., reviewers cannot trust the authors to implement them directly in the camera ready).

Q: When shall I recommend *rejection* instead of *major revision*?

A: *Rejection* is a more appropriate outcome than *major revision* if the requested additions/changes are not implementable in 8 weeks; if the contribution is very narrow or not relevant to the SE audience, and it cannot be retargeted in 8 weeks; if the methodology is flawed and cannot be fixed in 8 weeks; if results are unconvincing, the paper does not seem to improve the state of the art much, and new convincing results are unlikely to be available after 8 weeks of further experiments; if the customary benchmark used in the community was ignored and cannot be adopted and compared to in 8 weeks.

Q: When shall I recommend *acceptance* instead of *major revision*?

A: We do not want major revision to become the primary pathway for acceptance. We should continue to trust the authors to make minor changes to the submissions in the camera ready version. Acceptance is preferable if the requested additions/changes are nice to have features, not mandatory for the acceptability of the work; if minor improvements of the text are needed; if minor clarifications requested by the reviewers should be incorporated; if important but not critical references should be added and discussed; if discussion of results could be improved, but the current one is already sufficient.

Q: What is the difference between major *revision* and *shepherding*?

A: *Major revision is not shepherding*. While shepherding typically focuses on important but minor changes, which can be specified in an operational way and can be checked quite easily and quickly by reviewers, major revisions require major changes (although doable in 8 weeks), which means the instructions for the authors cannot be completely operational and the check will need to go deeply into the new content delivered by the paper. Hence, while the expectation for shepherded papers is that most of them will be accepted once the requested changes are implemented, this is not necessarily the case with major revisions.

Q: Is there a quota of papers that can have *major revision* as outcome?

A: As there is no quota for the accepted papers, there is also no quota for major revisions. However, we expect that thanks to major revisions we will be able to eventually accept 10-15% more papers, while keeping the quality bar absolutely unchanged.

Q: What shall I write in the meta-review of a paper with *major revision* outcome?

A: With the possibility of a *major revision* outcome, meta-reviews become extremely important. The *meta-review* should clearly and explicitly list all major changes required by the reviewers to make the paper acceptable for publication. The meta-review should act as a contract between reviewers and authors, such that when all required changes are properly made, the paper is accepted. In this respect, the listed changes should be extremely clear, precise, and implementable.

Review Process

For Authors

Q: Can I withdraw my paper?

A: Yes, papers can be withdrawn at any time using HotCRP.

For Reviewers

Q: The authors have provided a URL to supplemental material. I would like to see the material but I worry they will snoop my IP address and learn my identity. What should I do?

A: Contact the Program Co-Chairs, who will download the material on your behalf and make it available to you.

Q: If I am assigned a paper for which I feel I am not an expert, how do I seek an outside review?

A: PC members should do their own reviews, not delegate them to someone else. Please contact the Program Co-Chairs, especially since additional reviewers might have a different set of conflicts of interest.

Open Science Policy

Q: What is the ESEC/FSE 2023 open science policy and how can I follow it?

A: Openness in science is key to fostering scientific progress via transparency, reproducibility, and replicability. Upon submission to the research track, authors are asked to:

- make their data available to the program committee (via upload of supplemental material or a link to an anonymous repository) and provide instructions on how to access this data in the paper; **or**
- include in the paper an explanation as to why this is not possible or desirable; **and**
- indicate if they intend to make their data publicly available upon acceptance. This information should be provided in the submitted papers in a section named Data Availability after the Conclusion section. For more details, see the ESEC/FSE open science policy (https://2023.esec-fse.org/track/fse-2023-open-science-policy).

Q: How can I upload supplementary material via the HotCRP site and make it anonymous for double-anonymous review?

A: To conform to the double-anonymous policy, please include an anonymized URL. Code and data repositories may be exported to remove version control history, scrubbed of names in comments and metadata, and anonymously uploaded to a sharing site. Instructions are provided in the ESEC/FSE open science policy (https://2023.esec-fse.org/track/fse-2023-open-science-policy).

Double-Anonymous Reviewing (DAR)

Q: Why are you using double-anonymous reviewing?

A: Studies have shown that a reviewer's attitude toward a submission may be affected, even unconsciously, by the identity of the authors.

Q: Do you really think DAR actually works? I suspect reviewers can often guess who the authors are anyway.

A: It is rare for authorship to be guessed correctly, even by expert reviewers, as detailed in this study (https://arxiv.org/abs/1709.01609).

For Authors

Q: What exactly do I have to do to anonymize my paper?

A: Your job is not to make your identity undiscoverable but simply to make it possible for reviewers to evaluate your submission without having to know who you are: omit authors' names from your title page, and when you cite your own work, refer to it in the third person. Also, be sure not to include any acknowledgements that

would give away your identity. You should also avoid revealing the institutional affiliation of authors.

Q: I would like to provide supplementary material for consideration, e.g., the code of my implementation or proofs of theorems. How do I do this?

A: On the submission site, there will be an option to submit supplementary material along with your main paper. You can also share supplementary material in a private or publicly shared repository (preferred). This supplementary material should also be anonymized; it may be viewed by reviewers during the review period, so it should adhere to the same double-anonymous guidelines. See instructions on the ESEC/FSE open science policy (https://2023.esec-fse.org/track/fse-2023-open-science-policy).

Q: My submission is based on code available in a public repository. How do I deal with this?

A: Making your code publicly available is not incompatible with double-anonymous reviewing. You can create an anonymized version of the repository and include a new URL that points to the anonymized version of the repository, similar to how you would include supplementary materials to adhere to the Open Science policy. Authors wanting to share GitHub repositories may want to look into using https://anonymous.4open.science/ (https://anonymous.4open.science/) which is an open source tool that helps you to quickly double-anonymize your repository.

Q: I am building on my own past work on the WizWoz system. Do I need to rename this system in my paper for purposes of anonymity, so as to remove the implied connection between my authorship of past work on this system and my present submission?

A: Maybe. The core question is really whether the system is one that, once identified, automatically identifies the author(s) and/or the institution. If the system is widely available, and especially if it has a substantial body of contributors and has been out for a while, then these conditions may not hold (e.g., LLVM or HotSpot), because there would be considerable doubt about authorship. By contrast, a paper on a modification to a proprietary system (e.g., Visual C++, or a research project that has not open-sourced its code) implicitly reveals the identity of the authors or their institution. If naming your system essentially reveals your identity (or institution), then anonymize it. In your submission, point out that the system name has been anonymized. If you have any doubts, please contact the Program Co-Chairs.

Q: I am submitting a paper that extends my own work that previously appeared at a workshop. Should I anonymize any reference to that prior work?

A: No. But we recommend you do not use the same title for your ESEC/FSE submission, so that it is clearly distinguished from the prior paper. In general, there is rarely a good reason to anonymize a citation. When in doubt, contact the Program Co-Chairs.

Q: Am I allowed to post my (non-anonymized) paper on my web page or arXiv?

A: To facilitate double-anonymous reviewing, **we recommend the authors to postpone publishing their submitted work on arXiv or similar sites until after the notification**. If the authors have uploaded to arXiv or similar, they should avoid specifying that the manuscript was submitted to ESEC/FSE 2023.

Q: Can I give a talk about my work while it is under review? How do I handle social media?

A: We have developed guidelines, described here, to help everyone navigate in the same way the tension between the normal communication of scientific results, which double-anonymous reviewing should not impede, and actions that essentially force potential reviewers to learn the identity of the authors for a submission. Roughly speaking, you may (of course!) discuss work under submission, but you should not broadly advertise your work through media that is likely to reach your reviewers. We acknowledge there are grey areas and trade-offs; we cannot describe every possible scenario.

Things you may do:

- Put your submission on your home page.

- Discuss your work with anyone who is not on the review committees, or with people on the committees with whom you already have a conflict.
- Present your work at professional meetings, job interviews, etc.
- Submit work previously discussed at an informal workshop, previously posted on arXiv or a similar site, previously submitted to a conference not using double-anonymous reviewing, etc.

Things you should not do:

- Contact members of the review committees about your work, or deliberately present your work where you expect them to be.
- Publicize your work on major mailing lists used by the community (because potential reviewers likely read these lists).
- Publicize your work on social media if wide public [re-]propagation is common (e.g., Twitter) and therefore likely to reach potential reviewers. For example, on Facebook, a post with a broad privacy setting (public or all friends) saying, “Whew, ESEC/FSE paper in, time to sleep” is okay, but one describing the work or giving its title is not appropriate. Alternatively, a post to a group including only the colleagues at your institution is fine.

Reviewers will not be asked to recuse themselves from reviewing your paper unless they feel you have gone out of your way to advertise your authorship information to them. If you are unsure about what constitutes “going out of your way”, please contact the Program Co-Chairs.

Q: Will the fact that ESEC/FSE is double-anonymous have an impact on handling conflicts of interest? A: Double-anonymous reviewing does not change the principle that reviewers should not review papers with which they have a conflict of interest, even if they do not immediately know who the authors are. Authors declare conflicts of interest when submitting their papers using the guidelines in the Call for Papers. Papers will not be assigned to reviewers who have a conflict. Note that you should not declare gratuitous conflicts of interest and the chairs will compare the conflicts declared by the authors with those declared by the reviewers. Papers abusing the system will be desk-rejected.

For Reviewers

Q: What should I do if I learn the authors’ identity? What should I do if a prospective ESEC/FSE author contacts me and asks to visit my institution?

A: If you feel that the authors’ actions are largely aimed at ensuring that potential reviewers know their identity, contact the Program Co-Chairs. Otherwise, you should not treat double-anonymous reviewing differently from other reviewing. In particular, refrain from seeking out information on the authors’ identity, but if you discover it accidentally this will not automatically disqualify you as a reviewer. Use your best judgement.

Q: How do we handle potential conflicts of interest since I cannot see the author names?

A: The conference review system will ask that you identify conflicts of interest when you get an account on the submission system.

Q: How should I avoid learning the authors’ identity, if I am using web-search in the process of performing my review?

A: You should make a good-faith effort not to find the authors’ identity during the review period, but if you inadvertently do so, this does not disqualify you from reviewing the paper. As part of the good-faith effort, please turn off Google Scholar auto-notifications. Please do not use search engines with terms like the paper’s title or the name of a new system being discussed. If you need to search for related work you believe exists, do so after completing a preliminary review of the paper.

The above guidelines are partly based on the PLDI FAQ on double-anonymous reviewing and the ICSE 2022 guidelines on double-anonymous submissions.

Important Dates

AoE (UTC-12h)

Thu 24 Aug 2023
Camera ready

Thu 27 Jul 2023
Final notification for major revisions

Thu 29 Jun 2023
Revised manuscript submissions (major revisions only)

Thu 4 May 2023
Initial notification

Thu 2 Feb 2023
